Summary

FIU Computer Engineering graduate (Cum Laude) focused on backend and cloud-based systems. Built containerized API services using FastAPI, SQLAlchemy ORM, OAuth2 authentication, and PostgreSQL, with experience deploying Dockerized microservices to Kubernetes/OpenShift environments. Strong CS fundamentals (Data Structures, Operating Systems) and production experience managing live web infrastructure (DNS, SSL, CI/CD). Seeking Software Engineer or Backend Engineer roles (Remote or Hybrid in Tampa Bay). U.S. Work Authorized.

Education

Florida International University Dec 2025
Bachelor of Science in Computer Engineering, Cum Laude (GPA: 3.64) Miami, FL

- **Relevant Coursework:** Data Structures, Systems Programming, Embedded Operating Systems, Big Data Analytics, Cloud Computing

Experience

VIZA Migrant-Pro Solutions USA 2021 – Present
IT & Web Systems Lead (Part-Time) Sarasota/Bradenton, FL

- Built and maintained a production web platform using **HTML/CSS/JavaScript** with server-side modules in **Python (Flask)** and **Node.js**.
- Implemented a **Node.js YouTube API integration** with server-side caching logic to reduce redundant API calls and improve response performance.
- Developed a **Flask-based RSS parsing service** and designed a **GitHub Actions CI/CD pipeline** to automate deployments, while managing **DNS configuration** and **SSL certificate lifecycle**.

Projects

Concert Media Microservices Platform (IBM Capstone) | Python, Django, Flask, MongoDB, MySQL, Docker, Kubernetes, OpenShift

- Developed a containerized multi-service application with a Django core platform and dedicated media microservices.
- Implemented a MongoDB-based songs service and relational user authentication workflows.
- Built Docker images and deployed services to Kubernetes clusters using OpenShift on IBM Cloud.

FinanceTrackerService API Platform | Python, FastAPI, PostgreSQL, OAuth2, JWT, Docker Compose

- Designed a containerized microservice-style architecture with separate **authentication** and **transaction services**, communicating through isolated service dependencies.
- Implemented secure **OAuth2 authentication** and **JWT-based session management**, storing credentials, refresh tokens, and session data in dedicated PostgreSQL databases.
- Configured Alembic database migrations and automated startup scripts to initialize schema creation and service dependencies.
- Configured a **Docker Compose environment** running three coordinated containers (auth service, transaction service, PostgreSQL) supporting independent service deployment and database isolation.

Technical Skills

Languages: Python, Java, C, JavaScript, SQL, Bash
Frameworks: Flask, FastAPI, Django
Databases: PostgreSQL, MongoDB, MySQL, SQLite
Tools: Docker, Docker Compose, Git, GitHub Actions
Platforms: Linux, IBM Cloud, OpenShift, Kubernetes
